ARTESIA– COMMUNITY ECONOMIC ASSESSMENT

1. **Demographics**¹: Artesia's population is relatively stable, though slowly growing; the rate of growth of the Hispanic population far exceeds that of the White/non-Hispanic population; levels of educational attainment are very low.
 - a. Artesia's population grew by 3 percent between 1990 and 2000, below the 8.4 percent rate of growth in the SE New Mexico Region², and well below the 20 percent growth of the statewide population. Significantly, despite the slow growth of the town's population, the age distribution of the town's residents remains relatively balanced, with a small decline among the children under 5 years old matched by a similar decline in the senior population.
 - b. The number of persons relocating from out-of-county to Artesia has remained stable between the 1985-1990 and 1995-2000 periods, in contrast to declining rates for Eddy County and the Southeast New Mexico Region. Indeed, as a result of these dynamics, the size of Artesia's work force has been growing, up by nearly 10 percent from 1990 to 2000.
 - c. Artesia's population is slightly less than one half White/non-Hispanic and one half Hispanic³; Black or African Americans and Native Americans comprise the remaining 3 percent of the population. The Hispanic community is by far the fastest growing segment of the town's population. Between 1990 and 2000, the share of Artesia's population that is Hispanic increased from 39 to 47 percent; the White/non-Hispanic population share of the population fell proportionately. The growing presence of the Hispanic population in Artesia is part of a broader trend that is evident throughout New Mexico and the U.S. Indeed, although the share of Artesia's population that is Hispanic slightly exceeds that of New Mexico (43 percent) and far exceeds that of the U.S. (14 percent), the 25 percent growth of the Hispanic population in Artesia between 1990 and 2000 is well below the 33 and 61 percent increases in New Mexico and the U.S. respectively over the same period. Notably, despite the overall growth of the Hispanic population in Artesia, this group is becoming far more integrated within the community. The number of persons who, by Census definitions, are linguistically isolated, declined from 5 to 2 percent between 1990 and 2000.
 - d. The level of educational attainment in Artesia is, by any standard, very low. As in all parts of the country and the state, the number of persons

¹ See Table 1 in the appendix

² SE New Mexico Region in this report is defined as Eddy, Chaves, and Lea Counties.

³ Beginning in the 1990 Decennial Census and continuing in 2000, the Hispanic population is defined as an ethnic group rather than a race. Those who identify themselves as Hispanic in the Census are also self-defined by racial characteristics. For this reason, the sum of racial groups and Hispanic ethnicity is greater than the size of the total population.

ARTESIA MAINSTREET – Community Economic Assessment

without a high school degree has been declining, but in Artesia in 2000, 30 percent of the 25 years and older population had not completed high school (or earned a G.E.D.), compared to 24 percent in other parts of Eddy County, 21 percent in New Mexico, and 20 percent in the U.S. Even more pronounced is the limited achievement in higher education. In Artesia, only 16 percent of the 25 years and older population had earned a post-secondary degree, compared to nearly 20 percent in other parts of Eddy County and 29 percent in New Mexico.

2. **Housing**⁴: Based on available data through 2000, the supply of owner-occupied housing in Artesia is severely limited, resulting in sharp increases in housing costs and a decline in the rate of home ownership.
 - a. Between 1990 and 2000, the housing stock in Artesia increased by only 3 percent, slightly below the 5 percent increase in household formation; the increase was in the rental sector. The housing stock in Artesia is also very old: the median age of housing structures in Artesia was 38 years in Artesia in 2000, compared to 33 years in other parts of Eddy County and 23 years throughout New Mexico.
 - b. The consequences of slow housing construction in Artesia are not surprising. The value of owner-occupied housing increased by 6 percent in real terms during the 1990-2000 period, compared to real increases of 2 percent across New Mexico. Because of increasing housing values and stagnant wages, the cost of homeownership increased sharply, from 17.1 to 19.3 percent of median household income. Consequently, the rate of home ownership in Artesia fell from 69.4 to 68.1 percent; home ownership rates increased by 2 percent in both New Mexico and the U.S.
 - c. The stagnant supply of owner-occupied housing units and the increase in ownership costs were somewhat offset by the growth in the supply of rental units and, accordingly, an improvement in the affordability of rental housing.
3. **Income**⁵: Incomes in Artesia are below area and statewide averages.
 - a. Incomes in Artesia are low and, in real terms, flat. In 1999, average per capita income in Artesia was \$13,911, about 15 percent below the average for other parts of Eddy County (\$16,336) and 19 percent below the statewide average of \$17,261. Adjusting for inflation, the 1999 figure was about 0.5 percent less than in 1989; real incomes rose by 15 percent across New Mexico during the same period.
 - b. Low incomes in Artesia in 1999 (the most recent data for non-metropolitan areas) cannot be explained in terms of national economic patterns or oil prices that affect the regional economy. The rate of unemployment in Artesia in 1999 was below the statewide rate, and, though below prices

⁴ See Table 1 in the appendix

⁵ Ibid

ARTESIA MAINSTREET – Community Economic Assessment

during periods of Middle East turbulence, oil prices were up from previous lows.

- c. Rather, low average incomes are the result of persistent poverty among about 20 percent of Artesia's population. Between 1989 and 1999, poverty in other parts of Eddy County fell by 3.5 percentage points, to 17.1 percent, while New Mexico as a whole saw a decline to 18.4 percent. Further, to a greater extent than other parts of New Mexico and even Eddy County, low income households in Artesia saw a very sharp decline in public assistance, from 9 to 4 percent; in New Mexico as a whole the proportion of households receiving public assistance fell from 8 to 5 percent between 1989 and 1999⁶.

4. Economy⁷: For a small community of 11,000, Artesia's economy is diverse. The economy has strong 'base industries' (including oil & gas, utilities, construction, wholesale trade, transportation, federal government) that bring dollars into the community and strong retail and service sectors that recycle these dollars among local businesses. The weakness of the economy lies in its failure to provide adequate income for a sizeable minority of the population.

- a. Trade area: A map of the regional trade area is presented in Figure 3. Using standard regional economic measures based on population and economic activity, the outer limits of Artesia's trade area is estimated to be about a 20 minute drive from the town center, including most of northern Eddy County. However, geography tends to favor Artesia, as its central location with respect to communities in the southeastern region offers the town certain advantages. In general, Artesia is the regional market center for 'middle order' consumer goods and services such as clothing, groceries, auto repair and personal services⁸. Local and regional shoppers are somewhat more likely to go to larger cities, such as Roswell, for larger purchases. The advantages of Artesia's central location are more evident where transportation costs are determinant, such as the wholesale industry.
- b. Strengths: Base industries and retail provide a solid financial foundation for Artesia.

⁶ The number of households receiving public assistance fell in all parts of the U.S. following the 1996 implementation of welfare reform.

⁷ See tables 3-8 and figures 1-3 in the appendix

⁸ The trade area of a community is commonly defined in terms of the availability of goods and services. The smallest communities provide only the 'lowest order' goods and services, including frequently purchased items such as milk or newspapers; larger communities provide less frequently purchased, typically more expensive 'higher order goods' such as durable consumer goods (household appliances or automobiles) and specialized services (legal or healthcare); the highest order goods are available only in the very largest cities.

ARTESIA MAINSTREET – Community Economic Assessment

- i. Base industries generated \$200 million in taxable gross receipts in Artesia, accounting for a net inflow of \$112 million in 2005.⁹ This reflects continued and long term improvement – 2005 total taxable gross receipts were more than double those of 1989, adjusting for inflation. On a per capita basis, only oil & gas-rich Hobbs and Farmington, and Los Alamos, site of LANL, have greater financial inflows in New Mexico.
 - ii. Among the strongest sectors of Artesia’s economy are wholesale trade and transportation and warehousing, which generated an inflow of \$50 million in 2005. Comparing the performance of these sectors in Artesia with their relatively weak performance in Roswell and Carlsbad, it would appear that the community’s central location allows it to serve as a principal distribution center for the region.
 - iii. The retail sector, primarily discount or ‘Big Box’ retailers, also make a sizable contribution to Artesia’s economy, generating a net surplus of \$43 million in 2005. Together, net financial inflows associated with Artesia’s base industries and retail sector generate nearly \$3 million in gross receipts tax revenues for the town.
- c. Weaknesses: Strong industrial performance has not translated into income growth in Artesia, leaving more than 1 in 5 residents below the poverty line.
- i. Between 1989 and 1999 (the latest data for Artesia) average per capita incomes in Artesia, adjusted for inflation, fell slightly while incomes in the remainder of Eddy County and New Mexico as a whole increased by 13 percent and 15 percent, respectively. Stagnation of real earnings is not limited to the very poor – the median household income likewise fell during the 10 year period.
 - ii. Location quotients indicate the types of jobs found in the local economy, according to industry, type of employer, and occupations. A value of 1.00 (with a base geography of New Mexico) indicates that this employment in a given category is in proportion to New Mexico; a value less than 1.00 indicates that the employment category is less than proportionate and greater than 1.00 means that it is more than proportionate. Location quotients by industry show that employment in Artesia is relatively concentrated in mining, manufacturing and transportation – all high paying sectors – and that there are relatively few jobs in lower paying retail and services sectors. Similarly, a very large share of jobs in Artesia is created by private, for-profit firms, and very few jobs are with non-profit organizations and the public sector, again suggesting a tendency for relatively high wages. However,

⁹ ‘Base industries’ are those that market goods and services outside the local economy. Such industries draw revenues into the community and, to the extent that these revenues are effectively distributed and circulated, create and sustain local economic growth. Base industries include agriculture, mining, utilities, manufacturing, and some services.

location quotients for occupations may offer a partial explanation for low and stagnant wages in Artesia. These data show that management and professional employees are relatively few in Artesia, whether compared to the county, the region or, especially, the state. Likewise, higher paying service occupations, such as healthcare and protective services, are poorly represented in Artesia. Conversely, lower paying occupations such as administrative support, maintenance and material moving, are relatively plentiful. The overarching conclusion is that while Artesia features strong industries that draw substantial resources into the community, employment in these industries is mainly in lower-paying occupations, thus accounting for low average wages.

- 5. MainStreet¹⁰:** The economic structure of Artesia's downtown and the role that it plays in the overall economy is characteristic of a center of a much larger city. It offers a very solid foundation for the continued development of the MainStreet program.
- a. Artesia's MainStreet district is home to 22 percent of the town's businesses and 23 percent of the town's employment. MainStreet employers, on average, pay 17 percent higher wages than employers located in other parts of town.
 - b. Significantly, employers that predominate in the downtown area are engaged in business management and services. These employers include oil and gas companies and firms engaged in information, finance, insurance, administration and support services, and restaurants that are supported by these core businesses. The MainStreet district also has a number of small retail shops, although the vast majority of retail employment is concentrated in 'Big Box' outlets located outside downtown. Public institutions are all but absent from the downtown. This downtown structure is not characteristic of small towns in New Mexico (or other parts of the U.S.). In most small towns, private businesses have moved to office parks outside the downtown and public services and low-end retail have taken their place.
 - c. Compared to other towns in southeastern New Mexico (and most other parts of the state), the housing stock in downtown Artesia¹¹ is relatively sizeable (475 units, equal to about 10 percent of the total; 3 percent is typical for the region); fewer residential properties are very old and dilapidated, and the vacancy rate of 23 percent is lower than many towns, where commonly one-third or more of downtown housing units are empty.

6. Challenges and Opportunities

- a. Where many towns face vacancies and disinvestment, Artesia has a significant step up in the development of its downtown. Artesia's

¹⁰ See tables 9-14 and figures 4-6 in the appendix

¹¹ In this section, 'downtown Artesia' encompasses areas within a 1 minute drive of the center of the MainStreet district, which is a radius of about ½ mile.

ARTESIA MAINSTREET – Community Economic Assessment

advantages include a local economy that draws in much more activity than it leaks out, a location central to the Southeastern Region of New Mexico, and a well-established business community that provides stability to downtown markets.

- b. The establishment of the regional facilities of the Federal Law Enforcement Training Facility Center (FLETC) in Artesia provides the town, and the MainStreet district in particular, with a new market with significant potential. The Center trains rotations of about 200 young officers during brief stays in southeastern New Mexico; trainees receive stipends and have little time to travel outside the immediate area. Restaurants, cafes, drinking establishments and specialty retail would do well to establish strong relations with the FLETC facility.
- c. These factors offer Artesia MainStreet an opportunity to broaden the appeal of the downtown district. One possibility is to extend the life of the district into the evening and to weekends, maybe by encouraging the development of a hotel or other accommodations that provide a market for restaurants and other downtown services. Strong weekday trade serves to reduce the risks associated with the establishment of such businesses. Another option is for Artesia MainStreet to promote integration among southeastern New Mexico communities, possibly creating a regional destination for visitors interested in a multi-day excursion. As a central location in the region, Artesia would likely see the greatest benefits of a regional initiative.
- d. Perhaps the greatest challenge that Artesia faces is raising the standard of living of the 20 to 30 percent of the population near or below the poverty line. This is particularly important given the broad scope of socioeconomic change occurring throughout New Mexico and the southwestern U.S. Historically, a principal function of the downtown is to serve as a site of social development, where persons with diverse backgrounds form a common sense of community and place through daily interactions. Where this does not occur, downtowns can function instead as a site of contestation, where groups seek visibility. Artesia MainStreet can play a vital role in promoting the constructive use of downtown with the development of public space and facilities that involve a broader segment of the town's population. This may involve encouraging the development of parks, arts and entertainment facilities, and other spaces that may be attractive and useful to various segments of the local population.

EXPLANATION OF TABLES

Selected Demographic, Economic, and Housing Characteristics

Source: US Census Bureau, 1990 & 2000 Decennial Census.

Data is provided for your community, county and the state of New Mexico for the years 1990 and 2000. For the city and county, values are given in absolute terms and in percentages. For comparison, data is also provided for the county, region, and the state of New Mexico.

Southeastern New Mexico Region is classified as Lea, Eddy, and Chaves counties.

Eastern Plains Region is classified as Curry, De Baca, Guadalupe, Quay, and Roosevelt counties.

Taxable Gross Receipts and Pull Factors

Source: New Mexico Taxation and Revenue Department (NMTRD); calculations by UNM/BBER. Data is provided for the years 1989 and 2002 (SIC classification) and 2005 (NAICS classification).

In 2003, NMTRD switched from SIC (Standard Industrial Classification) to NAICS (North American Industrial Classification System) as a basis for statistical tabulation. It is not possible to compare most data from the two classification systems. Data from 1989 and 2002 are presented to allow for historical comparison. Data from 1989 is adjusted for inflation and is presented in 2002 dollars. Data from 2005 provides the most up-to-date account of gross receipts activities; the data is presented in 2005 dollars.

There are several problems associated with gross receipts data.

- The data does not account for the value of the products sold; rather data is categorized according to the type of business; i.e. sales of food from gasoline convenience stores are included in gasoline stations; groceries sold at Wal-Mart are included in Miscellaneous Retailers.
- Businesses are self-classified, and sometimes inaccurately so.
- Not all products are taxable as gross receipts in New Mexico; a notable example is gasoline. 2005 data includes both taxable gross receipts and deductions associated with food and medical spending.

A 'pull factor' indicates the capacity of an industrial sector (e.g., services, retail, and so on) to draw revenues into the local economy. A value of 100% is the break-even point – values greater than 100% indicate that the business sector is drawing revenues into the local economy (more money is spent in the economy by those whose income is earned outside the community and money is spent by locals outside the community), whereas values less than 100% indicate that the sector is leaking money to other communities. Net Gain/Loss is derived from the Pull Factors. It is calculated as the difference between actual gross receipts and

the ‘expected value’ of gross receipts (i.e. that which would be associated with a pull factor of 100%). As with all 1989 gross receipts data, it is presented in terms of 2002 dollars.

Note that it is natural that not all sectors will have a positive balance – every economy has its strengths and weaknesses. From a policy perspective, policies that reduce leakages and that exploit strengths are equally valid. The decision is a practical one – should energies be spent plugging holes or exploiting existing strengths?

Businesses by Industry, In MainStreet Service Area, 1995 and 2004

Source: NM Department of Labor, ES-202 (Covered Employment Statistics), 2005; calculations by UNM-BBER.

ES-202 data is provided to UNM-BBER by the NM Department of Labor under terms of confidentiality. Under the terms of this agreement, data can be reported only in aggregate or summary format, so that it is not possible to infer information pertaining to a specific business.

ES-202 data used in this report is ‘establishment-level’, meaning that UNM-BBER has information on industrial classification (NAICS), employment, and wages of each business establishment in the study area. Establishment-level data indicates that data is provided for each individual establishment; i.e. as opposed to a chain or brand. The key advantage of establishment level data is that UNM-BBER is able to code the data according to the specific address of the establishment, allowing for analysis on a micro-geographical scale. In this report, UNM-BBER has coded the data according to locations within the MainStreet district (MS), in other parts of the town (Town) or in unincorporated parts of the county (UNINCORP).

Location Quotients

Source: Census 2000 Summary File 3 (SF3); Tables 59-61. Calculations by UNM-BBER.

A location quotient indicates the relative concentration of employment by industry, occupations, and types of business ownership in a given community, county, or region. The measures are relative to that of a ‘base geography’. A location quotient is calculated as the ratio of local employment in a given industry, occupation, or ownership type to total employment, in relation to the same ratio for the base geography. Thus, a value of 1.00 indicates that employment for a given industry, occupation, or type of business ownership compared to total employment in the economy is in exact proportion to that of the base geography. Values greater than 1.00 indicate that the industry, occupation, or ownership is more than proportionate to that of the base geography; a value less than 1.00 indicates the opposite.

NOTE: Charts of location quotients are scaled to a value of 0, where this base indicates that employment for a given industry is the same proportion as the base

geography. This is done for presentational purposes. The location quotient can be used to indicate the structure or 'role' of a local economy within its larger geography. This applies equally to the role of a town's economy within the county, region, or state; a county's economy within the state; or a region's (multiple counties) economy within the state. As with pull factors, a location quotient helps to define the relative strengths and weaknesses of a local economy, measured in this case in terms of industrial, occupational, and ownership structures. Again, as with pull factors, this information can lead to policies that aim to strengthen weaknesses or exploit strengths; the decision is again one of practicality and strategy rather than theory.

Trade area

Sources: New Mexico Department of Labor, ES-202 (Covered Employment Statistics), 2005; Bureau of Labor Statistics, Product Line Data, calculations by UNM-BBER; ESRI® ArcGIS 9.0 Business Analyst; ESRI® StreetMap™ USA. ESRI data sources include: Bureau of Labor Statistics, Consumer Expenditure Surveys (CEX), 2001, 2002, and 2003; U.S. Bureau of the Census, Population Division. ("ESRI® Demographic Update Methodology 2006/2011, An ESRI® White Paper," Redlands, CA, June 2006.)

Market or trade areas were established by generating drive time polygons around each city, the foci being the MainStreet districts. A target location was established for each MainStreet area based upon descriptions and maps provided by each of the New Mexico MainStreet cities. This provided a representative focal point within the MainStreet boundaries, without specifying any one particular location.

Trade areas were based upon drive times to the MainStreet site. Drive time polygons are generated using actual street networks in ESRI StreetMap. Drive times are calculated using road access, road types, and speed limits. Trade areas were determined by creating drive time polygons on two different scales, local and regional. A local scale polygon was drawn for the area that would be within a 1 minute drive time, or about ½ mile walking distance, from the MainStreet site. Additional polygons were calculated at the local scale for 3 and 5 minute drive times. These times were chosen to reflect a short and convenient route from a home or hotel. On a regional scale, drive time polygons were calculated for times ranging from 5 to 45 minutes. The regional scale represents travel for dedicated purposes, such as supply replenishment, large item purchases, etc.

Trade area reports were generated for each of the drive time polygons. Reports included demographic, marketing, and retail expenditure data. The data is directly associated with the geographic areas overlaid by the drive time polygons. All of the population and marketing data for a particular polygon is representative of the people living within the boundaries of that region. This data is derived from the ESRI® ArcGIS 9.0 Business Analyst. The population data provided by this

ARTESIA MAINSTREET – Community Economic Assessment

program are geographically derived at the census block point level. The demographic, income, and expenditure data and projections utilized by ESRI® are derived from the U.S. Census Bureau and the Bureau of Labor Statistics' Consumer Expenditure Surveys.

The competition layers represented in the trade area analyses were derived from the New Mexico Department of Labor data combined with product line data from the Bureau of Labor Statistics. The proxy revenues, calculated by BBER, reflect the degree to which the competition has derived sales from the product line of interest.

* Misc Retailers (ALL) includes Department Stores, General Merchandise, and Misc Retailers.

All values are adjusted for inflation and reported in terms of 2002 dollars.

Data is classified according to Standard Industrial Classification (SIC). 1989 and 2002 are the first and last years for which comparable data are available.

Major sectors do not sum to total taxable gross receipts because non-classified businesses are not included.
